# Check if a set is a subset of another set.

Example:

Sample Input1:

mango apple

mango orange

mango

output1:

yes

set3 is subset of set1 and set2

input2:

mango orange

banana orange

grapes

output2:

no

## For example:

Test	Input	Result
1	mango apple mango orange mango	yes set3 is subset of set1 and set2
2	mango orange banana orange grapes	No

## Answer: (penalty regime: 0 %)

```
1    a=set(input())
2    b=set(input())
3    c=set(input())
4    v if(c.issubset(a) and (c.issubset(b))):
5         print("yes")
6         print("set3 is subset of set1 and set2")
7    v else:
8         print("No")
```

	Test	Input	Expected	Got	
~	1	mango apple mango orange mango	yes set3 is subset of set1 and set2	yes set3 is subset of set1 and set2	~
<b>~</b>	2	mango orange banana orange grapes	No	No	~

Correct

Question  ${\bf 2}$ 

Correct

Mark 1.00 out of 1.00

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

5

12234

Output:

1234

Example Input:

6

112233

Output:

123

#### For example:

Input	Result			
5	1	2	3	4
1				
2				
2				
3				
4				

## Answer: (penalty regime: 0 %)

10

Correct

Mark 1.00 out of 1.00

Given an array of integers nums containing n + 1 integers where each integer is in the range [1, n] inclusive. There is only **one repeated** number in nums, return this repeated number. Solve the problem using set.

## Example 1:

```
Input: nums = [1,3,4,2,2]
```

Output: 2

#### Example 2:

```
Input: nums = [3,1,3,4,2]
```

Output: 3

# For example:

Input	Result
1 3 4 4 2	4

## Answer: (penalty regime: 0 %)

```
1     a=list(map(int,input().split()))
2     b=set(a)
3     count=0
4     v for i in b:
5          count=a.count(i)
6     v     if count>1:
7          print(i)
```

	Input	Expected	Got	
~	1 3 4 4 2	4	4	~
~	1 2 2 3 4 5 6 7	2	2	~

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

# For example:

Input	Result
01010101010	Yes
010101 10101	No

#### **Answer:** (penalty regime: 0 %)

```
1  def is_binary_string(s):
2     unique=set(s)
3  if unique.issubset({'0','1'}):
4     return "Yes"
5  else:
6     return "No"
7  s=input()
8  print(is_binary_string(s))
```

	Input	Expected	Got	
~	01010101010	Yes	Yes	~
~	REC123	No	No	~
~	010101 10101	No	No	~

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a **DNA sequence**.

When studying DNA, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

## Example 1:

```
Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCC","CCCCCAAAAA"]
```

#### Example 2:

```
Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAAA"]
```

#### For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC CCCCAAAAA

#### Answer: (penalty regime: 0 %)

Question  ${\bf 6}$ 

Correct

Mark 1.00 out of 1.00

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

#### **Examples:**

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2

Explanation:

Pairs with sum K( = 13) are {(5, 8), (6, 7), (6, 7)}.

Therefore, distinct pairs with sum K( = 13) are { (5, 8), (6, 7) }.

Therefore, the required output is 2.
```

## For example:

Input	Result
1,2,1,2,5	1
1,2 0	0

## Answer: (penalty regime: 0 %)

	Input	Expected	Got	
<b>~</b>	5,6,5,7,7,8 13	2	2	<b>~</b>
<b>~</b>	1,2,1,2,5	1	1	<b>~</b>
~	1,2	0	0	~

Passed all tests! 🗸

Correct

```
Question 7
Correct
Mark 1.00 out of 1.00
```

You are given an integer tuple nums containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:

- 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
- 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

## Constraints

- The input tuple nums contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple nums as input and return the total number of operations as an integer.

#### Example:

```
Input: nums = (3, 4, -1)
Output: 5

Explanation:
Operation 1: [3, 4, -1] -> First element is not the smallest, move to the end -> [4, -1, 3]
Operation 2: [4, -1, 3] -> First element is not the smallest, move to the end -> [-1, 3, 4]
Operation 3: [-1, 3, 4] -> First element is the smallest, remove it -> [3, 4]
Operation 4: [3, 4] -> First element is the smallest, remove it -> [4]
Operation 5: [4] -> First element is the smallest, remove it -> [1]
```

#### For example:

Total operations: 5

Test	Result
<pre>print(count_operations((3, 4, -1)))</pre>	5

Answer: (penalty regime: 0 %)

#### Reset answer

```
1 ▼ def count_operations(nums: tuple) -> int:
2
        # Your implementation here
3
        a=list(nums)
4
        count=0
5 🔻
        while a:
6
            count+=1
7 ,
            if a[0]==min(a):
8
                a.remove(a[0])
9 🔻
                a.append(a.pop(0))
10
11
        return count
```

	Test	Expected	Got	
~	<pre>print(count_operations((5, 4, 3, 2, 1)))</pre>	15	15	~
~	<pre>print(count_operations((42, )))</pre>	1	1	~
~	<pre>print(count_operations((-2, 3, -5, 4, 1)))</pre>	11	11	~

Question **8**Correct
Mark 1.00 out of 1.00

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

Sample Input:

5 4

12865

26810

Sample Output:

1 5 10

3

Sample Input:

5 5

12345

12345

Sample Output:

NO SUCH ELEMENTS

## For example:

Input	Result
5 4	1 5 10
1 2 8 6 5	3
2 6 8 10	
5 5	NO SUCH ELEMENTS
1 2 3 4 5	
1 2 3 4 5	

## Answer: (penalty regime: 0 %)

```
1 a,b=map(int,input().split())
p=list(map(int,input().split()))
   q=list(map(int,input().split()))
4 p.extend(q)
5 s=set(p)
6 r=[]
7 v for i in s:
8
       count=p.count(i)
9 ▼
      if(count<2):
10
           r.append(i)
11 v if len(r)==0:
       print("NO SUCH ELEMENTS")
12
13 v else:
       print(*r)
14
       print(len(r))
```

	Input	Expected	Got	
~	5 4 1 2 8 6 5 2 6 8 10	1 5 10 3	1 5 10 3	~
~	3 3 10 10 10 10 11 12	11 12 2	11 12 2	~
~	5 5 1 2 3 4 5 1 2 3 4 5	NO SUCH ELEMENTS	NO SUCH ELEMENTS	~

Correct

Question  ${\bf 9}$ 

Correct

Mark 1.00 out of 1.00

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

## For example:

Input	Result
hello world ad	1

```

Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

## In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

#### Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
```

## Example 2:

```
Input: words = ["omk"]
Output: []
```

#### Example 3:

```
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

#### For example:

Input	Result
4 Hello Alaska Dad Peace	Alaska Dad
2 adsfd afd	adsfd afd

# Answer: (penalty regime: 0 %)

```
a=int(input())
1
2
    p=[]
